

In migrating my web services to a new server, I went ahead and upgraded the [OpenID library](#) that [parsed.org](#) and my other services use. Now they support [OpenID 2](#) (in addition to [OpenID 1](#)), so if your identifier is served by a compliant provider, you can just enter your provider's URL into the input box to make login seamless. For example, [myopenid.com](#) identifier users can simply enter [myopenid.com](#) into the input box. For other features provided by OpenID 2, (maybe) read [the spec](#).
